Pressure and Vac

Bouchier was approached by one of our clients in 2019 to manage and operate a fleet of pressure and vacuum equipment. This was a new scope of work for our company but was taken on in true Bouchier fashion with a strong safety mindset and tremendous respect for the risks associated with certain critical assignments. What started out as a dayshift operation quickly shifted to include nightshift and is now a comprehensive 24/7 service to the client. The scope of work involves a range of activities including diesel fuel delivery,

water delivery, industrial cleaning (steaming & pressure washing), cleaning of industrial vessels and mining shovels, cleaning of buildings and mechanic shops, landfill leachate level management, hydrovac excavation, trench shoring installation, vacuum skim layer of oily water, line jetting service, hydrotesting of piping and vessels, liquid chemical transportation/delivery, caustic flushes, and high-pressure industrial cleaning.

The Outcome

Even though it was outside our usual scope of work, this scope has been a success for Bouchier. Contributing to the success of this project is the team who truly represents Bouchier's values, strong safety mindset, industry knowledge, and experience. We have established ourselves as a reliable and knowledgeable contractor, particularly in critical breakdown situations. Thorough job assessments, good inventory management, and effective communication with the client are also key factors in achieving success delivering this work scope.
