Firewater

In 2014, Bouchier secured a maintenance contract for Firewater services at an oil sands site. The contract involved maintaining 700 assets within the Firewater system. Over the course of 9 years, Bouchier's expertise and reputation has allowed us to expand our services to multiple sites, servicing a total of 1,900 assets. Our offerings now include installation of new systems, system upgrades, and preventative/corrective maintenance for both above and below ground infrastructure.

We have developed a unique approach that combines Firewater, Hydrovac, and civil work, creating a "one-stop shop" experience for clients. This integrated team consists of project estimators, HSE professionals, Hydrovac excavation experts, confined space watch team members, operators, and leaders. The team's commitment to quality is supported by robust QA/QC documentation, which ensures compliance and reliability through comprehensive logs and procedures.

The Outcome

Our team has a continuous improvement mindset, resulting in cost savings over-time. With the creation of a preventative maintenance projection system and zoning maps, Bouchier can maximize resources. Thanks to our long-term business relationships with suppliers, we can supply and store materials as needed, allowing for preferred vendor pricing. Our synergistic approach includes 25 years of combined expertise, innovative solutions to safe below ground access, and great communication for ease of planning and execution of project from start to finish.
